

MARK LEVI ROWSE M. RAMOS

Full-Stack Software Engineer · Mobile & Web · AI-Native Development

Davao City, Philippines | +63 995 410 4919 | leviramos59@gmail.com | linkedin.com/in/rowserowserowse | github.com/Levi-Ramos

SUMMARY

Full-stack engineer shipping production mobile and web systems — primary developer of a Blazor payroll/HRMS client and sole developer of a greenfield Flutter app replacing a legacy Delphi system. Owns features end to end, from architecture through CI/CD, and picks up unfamiliar stacks and legacy systems quickly. Ships daily with an AI coding agent (Claude Code) through a spec-first workflow: PRD, implementation plan, then agent-driven build with managed context.

EXPERIENCE

ActiveSystems Software Inc. — Software Engineer (Full-Stack)

Jan 2025 – Present

ActiveWork — Payroll / HRMS Platform (Blazor · .NET Core · Next.js migration)

- **Owns** the Blazor web client as primary developer, delivering the majority of the platform's front-end feature set across 200+ Razor components.
- **Built and currently maintain** the Taxes domain module (tax table/bracket management, de-minimis benefit allowances, CRUD API) and the user invitation/account-access system (token-based invitations, temporary-password enforcement, password-reset flow), authoring the large majority of both current codebases.
- **Built** real-time backend notification services (ASP.NET Core SignalR, tenant/user-scoped broadcast groups) and Philippine statutory payroll calculators (SSS, PhilHealth, Pag-IBIG, withholding tax).
- **Engineered** a containerized deploy pipeline (GitHub Actions → Docker → GitHub Container Registry), adding a manual SSH-based deploy step to work around an isolated network with no CI runner access.

ActiveFieldSales — Field-Sales Mobile App (Flutter)

- **Architected and built** solo, from scratch, a greenfield Flutter/Bloc app replacing a legacy Delphi mobile client for the company's ERP product.
- **Owns** the iOS/Android release pipeline end to end (GitHub Actions + Fastlane) as sole author.

ServePOS — Point-of-Sale (Flutter, BIR-compliant)

- **Built and currently maintain** the Popular Items sales-reporting widgets and the end-of-shift cash-count validation gate (blocks reconciliation while hold or unpaid transactions remain open), authoring the large majority of both current codebases.
- **Built** a Provider-based permission-gate widget enforcing per-action authorization on sensitive operations (payments, discounts, reprints), with an override-login fallback; still intact in current production code.
- **Built** refund/return-transaction processing and on-hold order handling (hold, resume, cashier-scoped queues), plus Philippine statutory discount support (solo parent, national athlete, and other tagged categories).
- **Co-owns** mobile release automation (Fastlane, TestFlight/Play).

ActiveScorecard — Job-Ticket Tracking Portal (Delphi/Object Pascal · React/TypeScript)

- **Built** a role-based review-gating system for service-request modification requests — a new RBAC policy action routing requests to the correct authority tier, enforced with defense-in-depth (client-side hiding plus server-side rejection), backed by a database migration and a standalone test-runner project; fixed a QA-found cross-bucket bug post-release with regression tests.
- **Implemented** a dedicated ticket-creation email notification for the portal's public intake flow per an accepted ADR, with defensive null-handling for unassigned tickets.

Apollo Technologies Inc. — Full-Stack Developer

Jul 2024 – Dec 2024

- **Owned** the front-end reskin of a telecom billing system (Vue 3 / Quasar) and built a Flutter (Bloc) mobile loyalty/WiFi app for the same client, integrating a legacy provisioning system that returned scraped HTML instead of REST.
- **Collaborated** on the Flask API layer bridging that integration, and on a separate KillBill subscription-billing integration.

Department of Social Welfare and Development (NHTS) — Full-Stack Developer (Internship)

Oct 2023 – Feb 2024

- **Built** a document request management system with notification features for DSWD's National Household Targeting System (NHTS) department, working across the Laravel front-end and back-end.

Next BPO Solutions, Inc. — Backend Developer (Internship)

May 2023 – Aug 2023

- **Implemented** API functions for an employee module and contributed to database design (ERDs) on a backend team, under senior-developer guidance.

PROJECTS

- **Resume Fit Checker** ([live](#) · [source](#)): RAG-based résumé-vs-JD screener — chunks and embeds a résumé, parses the JD into discrete requirements via LLM, retrieves top-evidence chunks per requirement by cosine similarity, then verdicts each as match/partial/gap with cited evidence in a single scoring call. Next.js, Vercel AI SDK, Gemini.
- **Destiny 2 MCP Server** ([source](#)): Model Context Protocol server exposing a third-party game API as LLM-callable tools — inventory search, item transfer/equip, and native loadout management (list/snapshot/equip/clear) — over both a local stdio transport and a multi-user remote HTTP transport secured with OAuth (PKCE). TypeScript, Node.js, @modelcontextprotocol/sdk, Express.
- **Restaurant Ordering System with GPT multi-language support (capstone)**: Flutter mobile app and Laravel web app integrating OpenAI APIs for real-time menu translation; designed the MySQL schema for users, product catalog, and translations.

SKILLS

Languages: Dart, TypeScript, JavaScript, C#, PHP, Python, Java, Delphi/Object Pascal

Frontend & Mobile: Flutter (Bloc), Blazor, React / Next.js, Vue / Quasar

Backend: .NET Core (incl. SignalR), Laravel, Flask, Django

Databases: PostgreSQL (incl. Supabase-hosted), MySQL

AI-Assisted Development: Agentic coding with Claude Code — spec-driven implementation (PRD → plan → agent build), managed context, daily production workflow

Cloud & DevOps: Docker, GitHub Actions, GitHub Container Registry, Fastlane, Git

EDUCATION

B.S. Information Technology (Business Technology Management), University of Southeastern Philippines · 2020 – 2024
