SUMMARY

Full-stack engineer shipping production mobile and web systems. Primary developer of a Blazor payroll/HRMS client, sole developer of a greenfield Flutter app replacing a legacy Delphi system, and author of the release pipelines behind both. Works daily with an AI coding agent (Claude Code) on a spec-first workflow: PRD, implementation plan, then agent-driven build with managed context.

EXPERIENCE

ActiveSystems Software Inc. — Software Engineer (Full-Stack)

Jan 2025 – Present

ActiveWork — Payroll / HRMS Platform (Blazor · .NET Core · Next.js migration)

- **Owns** the Blazor web client as primary developer, delivering the majority of the platform's front-end feature set across 200+ Razor components.
- **Contributed** to the platform's Next.js 16 / React 19 web client, building the TanStack Query data layer for payroll reporting and for the account-access module (invitations, role updates, password resets, user search).
- **Built and currently maintain** the Taxes domain module (tax tables/brackets, de-minimis allowances, read/update API) and the token-based user invitation and account-access system, authoring the large majority of both current codebases.
- **Wrote** two of that client's Playwright end-to-end specs near-solo, inside the team's existing test harness.
- **Built** real-time backend notification services (ASP.NET Core SignalR, tenant/user-scoped broadcast groups) and Philippine statutory payroll calculators (SSS, PhilHealth, Pag-IBIG, withholding tax).
- **Engineered** a containerized deploy pipeline (GitHub Actions → Docker → GitHub Container Registry), with a manual SSH deploy step working around an isolated network with no CI runner access.

ActiveFieldSales — Field-Sales Mobile App (Flutter)

- **Architected and built** solo, from scratch, a greenfield Flutter/Bloc app replacing a legacy Delphi mobile client for the company's ERP product.
- **Owns** the iOS/Android release pipeline end to end (GitHub Actions + Fastlane) as sole author.

ServePOS — Point-of-Sale (Flutter, BIR-compliant)

- **Built and currently maintain** the Popular Items sales-reporting widgets and the end-of-shift cash-count validation gate (blocks reconciliation while hold or unpaid transactions remain open), authoring the large majority of both.
- **Built** a Provider-based permission-gate widget enforcing per-action authorization on sensitive operations (payments, discounts, reprints), with an override-login fallback.
- **Built** refund/return-transaction processing and on-hold order handling (hold, resume, cashier-scoped queues), plus Philippine statutory discount support.
- **Co-owns** mobile release automation (Fastlane, TestFlight/Play).

ActiveScorecard — Job-Ticket Tracking Portal (Delphi/Object Pascal · React/TypeScript)

- **Built** the product's deploy pipeline from scratch across three repositories — GitHub Actions with self-hosted runners, PowerShell packaging, Flyway migrations run from the deployed artifact, and health-probed in-place deploys with automatic rollback.

- **Took** the same product from no pipeline, no backups and no monitoring to a service-managed system — Windows-service backend verified by unattended reboot, nightly off-box backups whose weekly automated restore verification caught a real three-night silent failure, plus the health alerting built in response.
- **Built** a role-based review-gating system for service-request modification requests (new RBAC policy action, defense-in-depth enforcement, database migration) and a dedicated ticket-creation email notification for the portal's public intake flow.
- **Maintain** the company's public WordPress site, where clients view this portal's ticket report; fixed a broken embed by tracing the iframe refusal to the app's frame-ancestor restrictions.

Apollo Technologies Inc. — Frontend Developer (full-stack scope)

Jul 2024 – Dec 2024

- **Owned** the front-end reskin of a telecom billing system (Vue 3 / Quasar) and built a Flutter (Bloc) mobile loyalty/WiFi app for the same client, integrating a legacy provisioning system that returned scraped HTML instead of REST.
- **Collaborated** on the Flask API layer bridging that integration, and on a separate KillBill subscription-billing integration.

Internships — DSWD (NHTS), Full-Stack Developer · Next BPO Solutions, Inc., Backend Developer May 2023 – Feb 2024

- **Built** a document request management system with notification features for DSWD's National Household Targeting System, working across the Laravel front-end and back-end; earlier, implemented API functions for an employee module and contributed to database design (ERDs) at Next BPO Solutions.

PROJECTS

- **Groundtruth** ([live](#) · [source](#)): RAG-based résumé-vs-JD screener — chunks and embeds a résumé, parses the JD into discrete requirements via LLM, retrieves top-evidence chunks per requirement by cosine similarity, then verdicts each as match/partial/gap with cited evidence in a single scoring call. Next.js, Vercel AI SDK, Gemini.
- **Destiny 2 MCP Server** ([source](#)): Model Context Protocol server exposing a third-party game API as LLM-callable tools — inventory search, item transfer/equip, and native loadout management (list/snapshot/equip/clear) — over both a local stdio transport and a multi-user remote HTTP transport secured with OAuth (PKCE). TypeScript, Node.js, @modelcontextprotocol/sdk, Express.

SKILLS

Languages: Dart, TypeScript, JavaScript, C#, PHP, Python, Java

Frontend & Mobile: Flutter (Bloc), Blazor, React / Next.js (TanStack Query), Vue / Quasar, WordPress

Backend: .NET Core (incl. SignalR), Laravel, Flask

Testing: Playwright (end-to-end), Vitest, React Testing Library

Databases: PostgreSQL (incl. Supabase-hosted), MySQL

AI-Assisted Development: Agentic coding with Claude Code — spec-driven implementation (PRD → plan → agent build), managed context, daily production workflow

Cloud & DevOps: Docker, GitHub Actions, GitHub Container Registry, Fastlane, Git

EDUCATION

B.S. Information Technology (Business Technology Management), University of Southeastern Philippines · 2020 – 2024
